

$$9) \ y = (3x^3 + 1)(-4x^2 - 3)^4$$

$$10) \ y = \frac{(x^3 + 4)^5}{3x^4 - 2}$$

$$11) \ y = ((x + 5)^5 - 1)^4$$

$$12) \ y = (5x^3 - 3)^5 \sqrt[4]{-4x^5 - 3}$$

Critical thinking question:

- 13) Give a function that requires three applications of the chain rule to differentiate. Then differentiate the function.
