

7) A small pond contains five catfish and six bluegill. If seven fish are caught at random, what is the probability that exactly three catfish have been caught?

8) A class has six girls and five boys. If the teacher randomly picks six students, what is the probability that she will pick exactly three boys?

9) A jar contains seven black buttons and five brown buttons. If eight buttons are picked at random, what is the probability that at most five of them are black?

10) A gardener has fourteen identical-looking tulip bulbs, of which six will produce yellow tulips and eight will become pink. She randomly selects and plants eight of them and then gives the rest away. When the flowers start to bloom, what is the probability that at most four of them are yellow?
